0.1 Introduction

This tutorial is designed to help you learn data visualization analysis by providing simple and useful information in a way that is easy to follow and understand.

0.2 Preparation

In order to draw a chart, we need to include the required packages for visualization and dataset. For example, ggplot2 package is for drawing charts and gcookbook is for using pg_mean dataset.

```
library(ggplot2)
library(gcookbook)
```

0.3 Bar chart

In this section, we will draw a bar chart using pg_mean dataset. The dataset has two columns: group, weight.

pg_mean

```
group weight
1 ctrl 5.032
2 trt1 4.661
3 trt2 5.526
```

This dataset compares the weight across three groups:

- ctrl: Control group (baseline, weight = 5.032).
- trt1: Treatment 1 group (weight = 4.661).
- trt2: Treatment 2 group (weight = 5.526).

It initializes a ggplot with the dataset pg_mean.

aes(x = group, y = weight) specifies the aesthetics:

- x = group: Assign the group variable to the x-axis (categorical data, such as ctrl, trt1, trt2).
- y = weight: Assign the weight variable to the y-axis (numerical data).

geom_col():

- Adds a column geometry to the plot.
- geom_col() creates bars where the height of each bar corresponds to the value of weight for each group.

0.4 Bar chart with color

We can expand further our bar chart by adding colors to its shape and outline to add more visualization into it. However, first we need to include gcookbook for using pg_mean dataset and ggplot2 for drawing the chart.

```
library(gcookbook)
library(ggplot2)
```

Here we need to initializes pg_mean dataset by using gcookbook library within our code.

```
pg_mean
```

```
group weight
1 ctrl 5.032
2 trt1 4.661
3 trt2 5.526
```

A quick preview of pg_mean dataset.

```
ggplot(pg_mean, aes(x = group, y = weight)) +
geom_col(fill = 'cornsilk', colour = 'blue', size = .2)
```

As we demonstrate before at Bar chart, aes(x = group, y = weight) specifies the aesthetics:

- x = group: Assign the group variable to the x-axis (categorical data, such as ctrl, trt1, trt2).
- y = weight: Assign the weight variable to the y-axis (numerical data).

geom_col():

- Adds a column geometry to the plot.
- geom_col() creates bars where the height of each bar corresponds to the value of weight for each group.

Inside geom_col() command, fill = "cornsilk", colour = "blue", size = .2 specifies
the following:

- fill = "cornsilk": Assign color to the bar's area using the color "cornsilk".
- colour = "blue": Assign color to the bar's outline using the color "blue".
- size = .2: Specified the size of the outline for all the bar within the chart.

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font

Inside labs():

- title = 'Bar Chart w/ Color': To add "Bar Chart w/ Color" as the title.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

Bar Chart

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different colors on chart's area and outline like 'red' or 'green' as well as the size of your chart title and positioning (hjust = 1, size = 15).

0.5 Line chart

Using the same Preparation, we'll be using the same library which is gcookbook and ggplot2 library.

```
library(gcookbook)
library(ggplot2)
```

Here we need to initializes BOD dataset by using gcookbook() library within our code.

BOD

Time demand
1 1 8.3
2 2 10.3
3 3 19.0

```
4 4 16.0
5 5 15.6
6 7 19.8
```

A quick preview of BOD dataset.

```
ggplot(BOD, aes(x = Time, y = demand)) +
geom_line()
```

In this part of chart, aes(x = Time, y = demand) specifies the aesthetics:

- x = Time: Assign the Time variable to the x-axis.
- y = demand: Assign the 'demand variable to the y-axis (numerical data).

geom_line:

- Adds a line geometry to the plot.
- geom_line creates lines that connect data points over a continuous variable.

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

Inside labs():

- title = 'Line Chart': To add "Line Chart" as the title.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).

0.6 Histogram

In this part we'll be drawing the diamonds dataset as a histogram chart.

library(ggplot2)

To start, we'll be only using the gcookbook library to use the diamonds dataset.

diamonds

```
# A tibble: 53,940 x 10
   carat cut
                   color clarity depth table price
                                                         X
   <dbl> <ord>
                   <ord> <ord>

A quick preview of the diamonds dataset.

```
ggplot(diamonds, aes (x = carat)) +
  geom_histogram()
```

in this part of chart, aes (x = carat) specifies the aesthetics:

• x = carat: Assign the carat variable to the x-axis.

geom_histogram():

- Adds a frequency of column geometry similar to a bar to the plot.
- geom_histogram() visualizes the distribution of a continuous variable by dividing it into bins.

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

Inside labs():

- title = 'Histogram Chart': To add "Histogram Chart" as the title.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).

0.7 Correlation chart

In this part, we're going to make correlation/scatter chart using heightweight dataset.

```
library(gcookbook)
library(ggplot2)
```

Here we need to initialize the heighweight dataset using gcookbook library.

heightweight

	sex	ageYear	ageMonth	heightIn	weightLb
1	f	11.92	143	56.3	85.0

```

A quick preview of heightweight dataset.

```
ggplot(heightweight, aes(x = ageYear, y = heightIn)) +
  geom_point()
```

In this part of chart, aes(x = ageYear, y = heightIn specifies the aesthetics:

- x = ageYear: Assign ageYear as the x-axis label.
- y = heightIn: Assign heightInas the y-axis label.

geom_point():

- Adds multiple dots to the plots.
- geom_point() adds a layer of points to your plot, which creates a scatterplot.

```
labs(title = "Age and Height",
    x = 'Age (Year)',
    y = 'Height (Inch)',
    caption = 'By Daven, DV, THU, 2024') +
    theme(plot.title = element_text(hjust = 0.5, size = 20))
```

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

```
labs(title = "Age and Height by Gender",
    x = 'Age (Year)',
    y = 'Height (Inch)',
    caption = 'By Daven, DV, THU, 2024')
```

Inside labs():

- title = 'Histogram Chart': To add "Histogram Chart" as the title.
- x = 'Age (Year)': Assign 'Age (Year)' as the x-axis label.
- y = 'Height (Inch): Assign y = 'Height (Inch) as the y-axis label.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

Inside plot.title = element_text():

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

Age and Height

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).

0.8 Correlation chart: Color by group

Using the same dataset in Correlation Chart we can expand further our bar chart by adding colors to the dots to add more visualization into it.

```
library(gcookbook)
library(ggplot2)
```

Here we need to initialize the heighweight dataset using gcookbook library.

heightweight

```

A quick preview of heightweight dataset.

```
ggplot(heightweight, aes(x = ageYear, y = heightIn, color = sex)) +
geom_point()
```

In this part of chart, aes(x = ageYear, y = heightIn, color = sex) specifies the aesthetics:

- x = ageYear: Assign ageYear as the x-axis label.
- y = heightIn: Assign heightInas the y-axis label.
- color = sex: Assign color to sex (male, female).

geom_point():

- Adds multiple dots to the plots.
- geom_point() adds a layer of points to your plot, which creates a scatterplot.

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

```
labs(title = "Age and Height by Gender",
    x = 'Age (Year)',
    y = 'Height (Inch)',
    caption = 'By Daven, DV, THU, 2024')
```

Inside labs():

- title = 'Histogram Chart': To add "Histogram Chart" as the title.
- x = 'Age (Year)': Assign 'Age (Year)' as the x-axis label.
- y = 'Height (Inch): Assign y = 'Height (Inch) as the y-axis label.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

Age and Height by Gender

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).

0.9 Multigroup histogram

Similar to Histogram, in this part we'll be combining 2 different group into 1 singular chart.

```
library(ggplot2)
library(MASS)
library(tidyverse)
```

Here, we need to initialize the birthwt dataset by using the MASS library and tidyverse library to combine the 2 separate chart into 1 chart.

birthwt

```
low age lwt race smoke ptl ht ui ftv bwt 85 0 19 182 2 0 0 0 1 0 2523 86 0 33 155 3 0 0 0 0 3 2551
```

```

A quick preview of the birthwt dataset.

```
birthwt_mod <- birthwt
birthwt_mod$smoke <- recode factor(birthwt_mod$smoke, '0' = 'No Smoke', '1' = 'Smoke')</pre>
```

Before proceeding we need to make another copy the dataset make some modification into it.

birthwt_mod <- birthwt:</pre>

• This to make a copy of the original dataset, so any modification will go to birthwt_mod.

recode_factor:

- Converts or modifies the smoke variable to a factor (categorical variable).
- Making the values are interpreted as categories instead of numeric.

```
birthwt_mod$smoke, '0' = 'No Smoke', '1' = 'Smoke':
```

- Values in smoke that are O are replaced with the label 'No Smoke'.
- Values in smoke that are 1 are replaced with the label 'Smoke'.

```
ggplot(birthwt_mod, aes(x = bwt, fill = smoke)) +
geom_histogram(position = "identity", alpha = 0.4)
```

In this part of chart, $birthwt_mod$, aes(x = bwt, fill = smoke) specifies the aesthetics:

- x = bwt: Assign bwt variable to the x-axis.
- fill = smoke: Assign color based on the smoke variable ('No Smoke' and 'Smoke').

geom_histogram:

- Adds a frequency of column geometry similar to a bar to the plot.
- geom_histogram() visualizes the distribution of a continuous variable by dividing it into bins.

```
position = "identity", alpha = 0.4:
```

- position = "identity": Overlays the bars for both groups ('No Smoke' and 'Smoke').
- alpha = 0.4: Sets the transparency level for the bars to 0.4

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

```
labs(title = "Birth Weight",
    x = 'Birth Weight',
    y = 'Count',
    caption = 'By By Daven, DV, THU, 2024')
```

Inside labs():

- title = 'Birth Weight': To add "Birth Weight" as the title.
- x = 'Birth Weight': Assign 'Birth Weight' as the x-axis label.
- y = 'Count': Assign 'Count' as the y-axis label.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).

0.10 Density chart

In this section, will be plotting a density chart using faithful dataset.

```
library(ggplot2)
library(tidyr)
```

To start, we'll need to use the tidyr library to use the faithful dataset.

A quick preview of faithful dataset.

```
ggplot(faithful, aes(x = waiting, y = ..density..)) +
geom_density(fill = "blue", alpha = .2) +
xlim(35, 105)
```

In this part of chart, aes(x = waiting, y = ..density..) specifies the aesthetics:

- x = waiting: Assign waiting variable to the x-axis.
- y = ..density..: Assign ..density.. variable to the y-axis. (..density.. a special variable computed by geom_density()).

geom_density:

- Adds a density plot layer.
- geom_density creates smooth continuous variable version of the histogram plot.

Inside geom_density command, fill = "blue", alpha = .2 specifies the following:

- fill = "blue": Assign color to the bar's area using the color "blue".
- alpha = .2: Sets the transparency level for the bars to .2.

xlim(35, 105):

- Sets the limits of the x-axis to the range (35, 105).
- Values outside this range are excluded from the plot.

```
abs(title = "Density Chart",
    x = 'Waiting',
    y = 'Density',
    caption = 'By By Daven, DV, THU, 2024') +
    theme(plot.title = element_text(hjust = 0.5, size = 20))
```

To add more details on your chart, we can add labs() and theme() into our codes.

labs():

- Used to customized axis labels and legend titles.
- To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

```
labs(title = 'Density Chart',
    x = 'Waiting',
    y = 'Density',
    caption = 'By By Daven, DV, THU, 2024')
```

Inside labs():

- title = 'Density Chart': To add "Density Chart" as the title.
- x = 'Waiting': Assign 'Waiting' as the x-axis label.
- y = 'Density': Assign 'Density' as the y-axis label.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

Inside plot.title = element_text():

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

Density Chart

For a better view of the overall explanation above, this is the complete structure on how the codes *given above* should be arranged.

Note: You can use different colors on chart's curve like 'red' or 'green' as well as the size of your chart title and positioning (hjust = 1, size = 15).

0.11 Box plot

Our last section, will be plotting ToothGrowth dataset using a boxplot chart.

```
library(gcookbook)
library(ggplot2)
```

Here we need to initializes ToothGrowth dataset by using gcookbook() library within our code.

```

A quick preview of ToothGrowth dataset.

```
ggplot(ToothGrowth, aes(x = interaction(supp, dose), y = len)) +
geom_boxplot()
```

In this part of chart, aes(x = interaction(supp, dose), y = len) specifies the aesthetics:

- x = interaction(supp, dose): Assign interaction(supp, dose) variable to the x-axis label by combining levels of supp (VC or OJ) and dose (0.5, 1, or 2).
- y = len: Assign len variable to the y-axis.

geom_boxplot():

- Adds a boxplot layer to the plot.
- geom_boxplot summarizes the distribution of len for each group defined by the interaction of supp and dose.

To add more details on your chart, we can add labs() and theme() into our codes. labs():

• Used to customized axis labels and legend titles.

• To add title and caption unto the chart.

theme():

- Used to give plots a consistent customized look.
- Positioning your chart title and adjusting the size of your chart font.

```
labs(title = 'Boxplot with ggplot',
    x = 'Supp + Dose',
    y = 'Length',
    fill = 'Smoking Status',
    caption = 'By Daven, DV, THU, 2024')
```

Inside labs():

- title = 'Boxplot with ggplot': To add "Boxplot with ggplot" as the title.
- x = 'Supp + Dose': Assign 'Supp + Dose' as the x-axis label.
- y = 'Length': Assign 'Length' as the y-axis label.
- fill = 'Smoking Status': Assign the legend title for the fill to 'Smoking Status'.
- caption = 'By Daven, DV, THU, 2024': To add "By Daven, DV, THU, 2024" as the caption.

```
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Inside theme():

• plot.title = element_text(): To customize the title chart to your desire output.

Inside plot.title = element_text():

- hjust = 0.5: Positioning your chart title in the middle.
- size = 20: Sizing your title text to size 20.

```
caption = 'By Daven, DV, THU, 2024') +
theme(plot.title = element_text(hjust = 0.5, size = 20))
```

Boxplot with ggplot

For a better view of the overall explanation above, this is the complete structure on how the codes given above should be arranged.

Note: You can use different size of your chart title and positioning (hjust = 1, size = 15).
